Executive Summary

Article 6 assessments are required under the Habitats Directive (92/43/EEC), and are required where a plan or project may give rise to significant effects upon a Natura 2000 site. Natura 2000 sites are those identified as sites of Community importance designated under the Habitats Directive (Special Areas of Conservation, here after referred to as SACs) or the Birds Directive (Special Protection Areas, here after referred to as SPAs). In the case of the present assessment, Ramsar sites are also included by way of best practice. It is important to note that the phrase ‘Appropriate Assessment’ is sometimes used more loosely to refer to the whole process set out under Articles 6(3) and 6(4) of the Habitats Directive (Dodd et al., 2008), and therefore note that for the present assessment the term ‘Article 6 assessment’ will be used, not ‘Appropriate Assessment’ (which refers to Stage 2 in the sequence under Article 6 assessment).

Guidance on Strategic Environmental Assessment (SEA) produced by the EPA (EPA, 2008) provides a useful definition of Article 6 assessments (referred to as appropriate assessment in that document) (EPA, 2008): “An assessment based on best scientific knowledge, of the potential impacts of the plan on the conservation objectives of any Natura 2000 site (including Natura 2000 sites not situated in the area encompassed by the draft plan or scheme) and the development, where necessary, of mitigation or avoidance measures to preclude negative effects”. Importantly, an Article 6 assessment has a narrow focus i.e. the maintenance of the integrity of the site and assessing the significance of the effects on designated interest features and the conservation objectives of the site. It is a protection led assessment and is carried out using the precautionary principle.

The assessment of the present proposal for licensing the Waste Water Discharge at Tory Island HS WWTP concluded the following:

The screening process has been undertaken to identify the qualifying interests and potential impacts arising from the Tory Island HS WWTP Wastewater treatment plant.

The process has shown that there are no negative effects on any Natura 2000 site arising from the discharges from the Tory Island HS WWTP agglomeration. It is unlikely that there will be ‘in combination’ negative effects from any other additional plans or developments in the catchment.
Introduction

Article 6 is one of the most important articles of the Habitats Directive in determining the relationship between conservation and site use. Article 6(3) requires that “Any plan or project not directly connected with or necessary to the conservation of a site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site’s conservation objectives.” The purpose of this report is to describe how that Article 6 assessment was carried out, and also to detail the results and conclusions from the assessment.

Waste Water Discharge (Authorisation) Regulations

Local Authorities are required to carry out an Appropriate Assessment as per article 6 of the Habitats Directive (92/43/EEC (2000)) in relation to waste water authorisations pursuant to the Waste Water Discharge (Authorisation) Regulations, 2007 (S.I. No. 684 of 2007).

The specific objectives of the WWDA Regulations are contained within the regulations.

Article 6 Assessment

The Council Directive 92/43/EEC on the Conservation of Natural Habitats and of Wild Fauna and Flora better known as “The Habitats Directive” provides the framework for legal protection for habitats and species of European importance. Articles 3 to 9 provide the legislative means to protect habitats and species of Community interest through the establishment and conservation of a EU-wide network. The Habitats Directive and the Birds Directive and sites designated under them form this network of European protected sites that are better known as the Natura 2000 network. This consists of;

Special Areas of Conservation (SACs) for flora, fauna and habitats of Community interest under the EU Habitats Directive;

Special Protection Areas (SPAs) for rare, vulnerable or migratory birds under the EU Birds Directive;

Sites that are being considered for designation as one of the above are referred to as cSAC (candidate) or pSPA (proposed).

Ramsar sites are wetlands of global importance, listed under the Convention on Wetlands of International Importance. Ramsar sites are contained within Natura 2000 sites and for that reason, and in line with best practice, Ramsar sites, if present would have been included in this assessment.

Article 6 sets out provisions, which govern the conservation and management of Natura 2000 sites. Article 6(3) and 6(4) of the Habitats Directive set out the decision-making tests for
plans and projects likely to affect Natura 2000 sites. Article 6(3) establishes the requirement for Appropriate Assessment:

“Any plan or project not directly connected with or necessary to the management of the [Natura 2000] site but likely to have a significant effect thereon, either individually or in combination with other plans and projects, shall be subjected to appropriate assessment of its implications for the site in view of the site’s conservation objectives. In light of the conclusions of the assessment of the implication for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public”

This assessment is underpinned by the precautionary principle, especially in the assessment of potential impacts and their resolution. If it is not possible to rule out a risk of harm on the evidence available then it is assumed a risk may exist and it needs to be dealt with in the appropriate assessment process.

**Stages of the Article 6 assessment**

The stages of an Article 6 assessment are outlined in the European Commission Methodological Guidance on the provision of Article 6(3) and 6(4) of the ‘Habitats’ Directive 92/43/EEC (EC 2001) and the European Commission Guidance ‘Managing Natura 2000 Sites’. These are set out below in line with EPA guidance on Appropriate Assessment for Waste Water Discharge Licensing.

**Stage 1 - Screening**

Step 1: Management of the site. In the case of all waste water discharges the project is not connected with, or necessary to the management of a Natura 2000 site

Step 2: Description of the Project (in this case the Tory Island HS WWTP) and identification of European sites that may be affected (including ‘in combination’ effects)

Step 3: Characteristics of the site identifying areas where the project may impact on European sites.

Step 4: Assessment of Significance. Assessment of the likelihood of significant effects of the project on European sites, including individual and cumulative impacts. Exclusion of site where it can be objectively concluded that there will be no significant effects and hence no requirement to proceed to further stages.
Stage 2 - Appropriate Assessment (AA)

Step 1: Information collation of likely effects of project and impacts on European site.

Step 2: Description of the Natura 2000 sites, including qualifying interests.

Step 3: Identification of the conservation objectives for of these sites and potential significant impacts likely to occur from the proposal

Step 4: Identification and assessment of mitigation measures against any likely adverse effects of the Project.

Stage 3 - Assessment of alternative solutions

Step 1: Identification of alternative solutions

Step 2: Assessment of alternative solutions

Stage 4 – Imperative Reasons of Overriding Public Interest

Confirm that there are a) imperative reasons of overriding public interest and b) human health or safety considerations or important environmental benefits. If this is so then compensation measures are required for any remaining adverse effect.
Results of Tory Island HSWWTP Assessment

Stage 1 – Screening

**Step 1: Management of the Site.**

The project is a WWTP and therefore is not directly connected with or necessary for the management of the European sites involved.

**Step 2: Description of Project and European Sites**

*Description of the Project*

The Tory Island HS housing scheme Treatment Unit is designed to serve a population of 18. It consists of a package plant with a puraflo bed followed by discharge of the treated effluent to a system of spreader drains to ground. It is not located in a Natura 2000 area.

*European Natura 2000 Sites*

Discharge is to ground irrigation and not to the receiving surface waters of an SAC

*Other Discharges to Recieving Waters*

Discharge is to ground irregation and not to the receiving surface waters of an SAC

**Step 3: Potential Impacts**

There are no potential impacts considered potentially possible

*Cumulative, Direct, Indirect, Short& Long Term Effects*

As the discharge is to ground from the Tory Island HS agglomeration any cumulative, direct indirect short and long-term impacts on any Natura 2000 site are not considered potentially possible.

**Step 4 Likely Significance of Impacts**

*SAC Water Dependant habitats potentially impacted by Tory Island HS WWTP*

Due to the nature of the discharge methodology no impact on any of the qualifying interest on any Natura 2000 site is considered likely
Other Policies, Plans or Projects

There are no current proposals for further developments that would create discharges into receiving waters.

Conclusion

The screening process has been undertaken to identify the qualifying interests of Natura 2000 sites and potential impacts arising from the wastewater discharges from the Tory Island HS agglomeration.

The process has shown that there will be no significant negative effects on a Natura 2000 sites arising from the Tory Island HS agglomeration. It is also concluded that there will be no ‘in combination’ negative effects from any other plans or developments in the catchment.

In conclusion the AA has determined that the discharges from the Tory Island HS agglomeration will not adversely impact in any significant manner on any Natura 2000 site, the qualifying interests or conservation objectives.
