Drinking Water Quality in Public Supplies 2020

ENVIRONMENTAL PROTECTION AGENCY

The Environmental Protection Agency (EPA) is responsible for protecting and improving the environment as a valuable asset for the people of Ireland. We are committed to protecting people and the environment from the harmful effects of radiation and pollution.

The work of the EPA can be divided into three main areas:

Regulation: We implement effective regulation and environmental compliance systems to deliver good environmental outcomes and target those who don't comply.

Knowledge: We provide high quality, targeted and timely environmental data, information and assessment to inform decision making at all levels.

Advocacy: We work with others to advocate for a clean, productive and well protected environment and for sustainable environmental behaviour.

Our Responsibilities

Licensing

We regulate the following activities so that they do not endanger human health or harm the environment:

- waste facilities (e.g. landfills, incinerators, waste transfer stations);
- large scale industrial activities (e.g. pharmaceutical, cement manufacturing, power plants);
- intensive agriculture (e.g. pigs, poultry);
- the contained use and controlled release of Genetically Modified Organisms (GMOs);
- sources of ionising radiation (e.g. x-ray and radiotherapy equipment, industrial sources);
- large petrol storage facilities;
- · waste water discharges;
- dumping at sea activities.

National Environmental Enforcement

- Conducting an annual programme of audits and inspections of EPA licensed facilities.
- Overseeing local authorities' environmental protection responsibilities.
- Supervising the supply of drinking water by public water suppliers.
- Working with local authorities and other agencies to tackle environmental crime by co-ordinating a national enforcement network, targeting offenders and overseeing remediation.
- Enforcing Regulations such as Waste Electrical and Electronic Equipment (WEEE), Restriction of Hazardous Substances (RoHS) and substances that deplete the ozone layer.
- Prosecuting those who flout environmental law and damage the environment.

Water Management

- Monitoring and reporting on the quality of rivers, lakes, transitional and coastal waters of Ireland and groundwaters; measuring water levels and river flows.
- National coordination and oversight of the Water Framework

 Directive
- Monitoring and reporting on Bathing Water Quality.

Monitoring, Analysing and Reporting on the Environment

- Monitoring air quality and implementing the EU Clean Air for Europe (CAFÉ) Directive.
- Independent reporting to inform decision making by national and local government (e.g. periodic reporting on the State of Ireland's Environment and Indicator Reports).

Regulating Ireland's Greenhouse Gas Emissions

- Preparing Ireland's greenhouse gas inventories and projections.
- Implementing the Emissions Trading Directive, for over 100 of the largest producers of carbon dioxide in Ireland.

Environmental Research and Development

• Funding environmental research to identify pressures, inform policy and provide solutions in the areas of climate, water and sustainability.

Strategic Environmental Assessment

• Assessing the impact of proposed plans and programmes on the Irish environment (e.g. major development plans).

Radiological Protection

- Monitoring radiation levels, assessing exposure of people in Ireland to ionising radiation.
- Assisting in developing national plans for emergencies arising from nuclear accidents.
- Monitoring developments abroad relating to nuclear installations and radiological safety.
- Providing, or overseeing the provision of, specialist radiation protection services.

Guidance, Accessible Information and Education

- Providing advice and guidance to industry and the public on environmental and radiological protection topics.
- Providing timely and easily accessible environmental information to encourage public participation in environmental decision-making (e.g. My Local Environment, Radon Maps).
- Advising Government on matters relating to radiological safety and emergency response.
- Developing a National Hazardous Waste Management Plan to prevent and manage hazardous waste.

Awareness Raising and Behavioural Change

- Generating greater environmental awareness and influencing positive behavioural change by supporting businesses, communities and householders to become more resource efficient.
- Promoting radon testing in homes and workplaces and encouraging remediation where necessary.

Management and structure of the EPA

The EPA is managed by a full time Board, consisting of a Director General and five Directors. The work is carried out across five Offices:

- Office of Environmental Sustainability
- Office of Environmental Enforcement
- Office of Evidence and Assessment
- Office of Radiation Protection and Environmental Monitoring
- Office of Communications and Corporate Services

The EPA is assisted by an Advisory Committee of twelve members who meet regularly to discuss issues of concern and provide advice to the Board.

Appendix F: Boil Notices and Water Restriction Notices in place during 20203

Executive Summary

Drinking water is sourced from rivers, lakes, springs, and groundwater and must be treated to make it clean and safe to drink before it is supplied to consumers. Compliance with the microbiological and chemical standards for drinking water remains high at greater than 99.5%, which means the water in our public water supplies is safe to drink. While there has been good progress recently, drinking water treatment in many supplies is still not as robust as it needs to be to ensure the supply is resilient and safe into the future.

The EPA has identified a priority list of "at-risk" drinking water supplies, the Remedial Action List (RAL), that must be improved to ensure that water supplies continue to be safe to drink and are also secure in the future. The list includes supplies such as Cork City (serving over 90,000 people), Longford Central (around 17,000), and Corofin, Co. Clare (around 1,300). Irish Water is making progress in resolving issues and the number of priority supplies has reduced from 77 to 46 over the past four years. Some of the key achievements in 2020 include the completion of upgrades at Staleen (serving over 70,000 people), Lough Talt (over 12,500), and Ballyhooly (around 1,200) water treatment plants.

While Irish Water continue to make progress with a net reduction in supplies on the RAL, the EPA has serious concerns about the time it takes to implement improvements. Of the 46 supplies on the RAL at the end of 2020, almost half will now take longer to complete than was anticipated at the end of 2019, for example, Clonmel-Poulavanogue. At the end of 2018, Irish Water had said this supply was due to be completed in December 2020; it now has a completion date of December 2026. A supply may be placed on the RAL if it cannot consistently be ensured that the drinking water is free from bacteria, protozoan organisms or chemical substances, and that the treatment plant is operated effectively and correctly. People can become ill from drinking inadequately treated water and this can be very severe, particularly in vulnerable people, such as the young and the elderly.

Drinking Water Priorities and Challenges

Ensure that water is free from bacteria. Irish Water continues to undertake upgrades to disinfection systems across the country to ensure the quality of drinking water is safeguarded and free from bacteria. In light of EPA audit findings, Irish Water needs to review all Disinfection Programme assessments to ensure disinfection contact time is adequate to protect public health.

Ensure that water is free of protozoan organisms. While the number of detections of *Cryptosporidium/Giardia* have reduced by one third since 2019, the EPA is concerned that protozoan organisms are still being detected in treated water due to a failure to properly manage treatment processes. It is critical that Irish Water put the appropriate control measures in place to ensure the correct operation of treatment processes. An example of where this was achieved is Leixlip Water Treatment Plant, which supplies over 590,000 people. This supply was removed from the RAL in July 2021 following filter upgrades and the installation of UV disinfection.

Ensure that water is free of chemical substances. The number of supplies failing to meet the trihalomethane standard continues to decrease each year. However, more work is required to address the remaining sites that continue to have THMs exceedances. In addition, the European Commission has issued a Reasoned Opinion¹ with regard to Ireland's poor record of compliance with the trihalomethane standard. Another cause for concern is the increase in the number of supplies where pesticides were detected. The challenge is to engage with multiple stakeholders in a catchment to prevent this problem at the source.

Ensure that water treatment plants are operated effectively and correctly. While it is an essential step to have all required infrastructure in place, a water treatment plant must also be managed and operated effectively and correctly and be able to adapt and respond to changing conditions and incidents. Essential alarms, monitors and staff training are critical prerequisites for a well-run drinking water treatment plant.

¹ Infringement case number 2017/4007

Boil notices continued to be a feature of life affecting 74,955 consumers during 2020, with nearly two-thirds of the notices in place for more than 30 days. Assessments and improvements under Irish Water's National Disinfection Programme have not proved sufficiently robust to mitigate the need for boil notices.

There was limited progress by Irish Water in 2020 to replace lead connections with only 1.5% of connections replaced compared to 8% in 2019. At the 2020 replacement rate it will take decades for Irish Water to remove all lead connections. Another cause for concern is that the Department of Housing, Planning and Local Government has not yet published a progress report on the National Lead Strategy. This limited progress is concerning given the forthcoming reduced limit for lead in the new Drinking Water Directive.

Irish Water has begun using Drinking Water Safety Plans to identify the risks on our public water supplies, which will also serve to improve the long-term security of supplies. It will take substantial investment over many years to improve the security of supplies, but adopting the Drinking Water Safety Plan approach should allow Irish Water to target actions to address the greatest risks. The new Drinking Water Directive (EU) 2020/2184 is to be transposed into Irish law by January 2023 and it is anticipated that this will put the requirement for Drinking Water Safety Plans on a statutory footing.

Summary of key actions recommended for Irish Water

- Complete upgrades to resolve issues with the drinking water supplies on the RAL, without further delays, to ensure risks to drinking water quality are addressed.
- Progress the assessments of disinfection systems, including rechecking of the chlorine contact times, to ensure drinking water is adequately disinfected and free from bacteria.
 Critical alarms and monitors must be functioning at all times.
- Substantially progress drinking water safety plan assessments to identify risks at drinking water supplies to safeguard the long-term security of water supplies and mitigate the risk.
- Expedite lead connection replacements. The Department of Housing, Planning and Local
 Government needs to publish the progress report on the national lead strategy.

1 Introduction

This report by the Environmental Protection Agency (EPA) provides a summary of our assessment of drinking water quality in public supplies and public group water schemes in Ireland during 2020. Every day, drinking water is supplied to approximately 1.3 million households² from public supplies. Irish Water is the national water utility responsible for providing this essential service. Irish Water also provides water from its treatment plants to public group schemes. The EPA is the drinking water quality regulator, responsible for enforcing the Drinking Water Regulations³. The Commission for Regulation of Utilities is the economic regulator of Irish Water.

A drinking water supply includes the abstraction, treatment, storage and distribution of water from the water source to the consumer's tap. The raw water sources, which are rivers, lakes, springs and groundwater, can be a source of contaminants if the water is not properly managed and treated at all stages of the process. Irish Water must ensure that the drinking water they supply meets the standards set out in the Drinking Water Regulations and therefore is safe to drink. Failure to meet those standards can put public health at risk. The Health Service Executive must be consulted by Irish Water where there could be a public health risk. In these events, a boil water notice or water restriction may be imposed.

Drinking water must be **safe** for consumers to drink, not just today, but every day. If a supply is meeting the drinking water standards today and is safe to drink, the supply also needs to be **secure** to prevent the risk of water quality failures in the future. The security of a supply is dependent on the risks to the supply, the adequacy of the water treatment infrastructure, and the management and operational controls in place. The EPA has identified a list of at risk supplies called the Remedial Action List (RAL) (*Appendix A*) where either the safety and/or security of the supply is not acceptable and Irish Water are required to put an action plan in place to rectify the issues at each of these supplies. National programmes on improving disinfection and reducing trihalomethanes, pesticides, and exposure to lead are also ongoing. Irish Water have committed to the Drinking Water Safety Plan approach, to identify and mitigate risks at supplies, in order to improve the security of supplies.

² CSO, Census 2016

³ European Union (Drinking Water) Regulations 2014, S.I. 122 of 2014 (as amended)

2 Drinking water quality

Water quality in public supplies

Irish Water monitors drinking water quality in public supplies to ensure that it meets the standards set out in the Drinking Water Regulations and is safe to drink. Compliance remains consistently high year to year, with results for 2020 of:

99.96%	Microbiological parameters					
99.71%	Chemical parameters					
99.14%	Indicator parameters					

The results show that water quality from public supplies remains very good and consumers can be confident that it is safe to drink. A summary of the results can be found in *Appendix B*. Non-regulatory monitoring (investigative and operational monitoring) is also carried out and may find failures, which must also be notified to the EPA and investigated by Irish Water.

Irish Water is also required under the Radioactive Substances in Drinking Water Regulations⁴ to monitor for radioactivity parameters. The parametric values for radioactive substances were not exceeded in any of the public water supplies tested in 2020.

Water quality in public group schemes

Irish Water also provides water to public group schemes. Local authorities regulate these supplies and ensure that monitoring is carried out. Water quality from public group schemes is also very good and compliance remains consistently high year to year, with results for 2020 of:

99.89%	Microbiological parameters						
99.24%	Chemical parameters						
99.37%	Indicator parameters						

A summary of the results can be found in Appendix C.

⁴ European Union (Radioactive Substances in Drinking Water) Regulations 2016, S.I. 160 of 2016

3 Priorities for Drinking Water Supplies

The EPA's Remedial Action List (RAL) is a priority list of at-risk supplies that require significant corrective action, and Irish Water are required to put an action plan in place to rectify the issues at each of these supplies. A supply may be placed on the RAL if it meets any of the criteria set out in Table 1.

Table 1: Remedial Action List criteria

Drinking Water Criteria 1: Ensure that water is free of bacteria

- Inadequate disinfection
- Failure to meet E. coli/Entercocci standard

Drinking Water Criteria 2: Ensure that water is free of protozoan organisms

- Inadequate Treatment for Cryptosporidium
- Supply identified by the HSE where further investigation or improvement may be required

Drinking Water Criteria 3: Ensure that water is free of chemical substances

- Disinfection by-products (trihalomethanes)
- Pesticides

Drinking Water Criteria 4: Ensure that water treatment plants are operated correctly

- Excessive levels of aluminium in the treated water
- Poor turbidity removal
- EPA Audit Observation / Treatment and Management Issues

When Irish Water has shown that the issue has been fixed, a supply can be removed from the list. The RAL is updated quarterly, and you can keep up to date with it through the EPA's website at https://www.epa.ie/publications/compliance--enforcement/drinking-water/.

Findings for 2020

At the end of 2020, 46 supplies were on the RAL. Details can be seen in *Appendix A* and also <u>here</u> on the EPA website. The number of supplies on the RAL has reduced by 40% (from 77) since 2017.

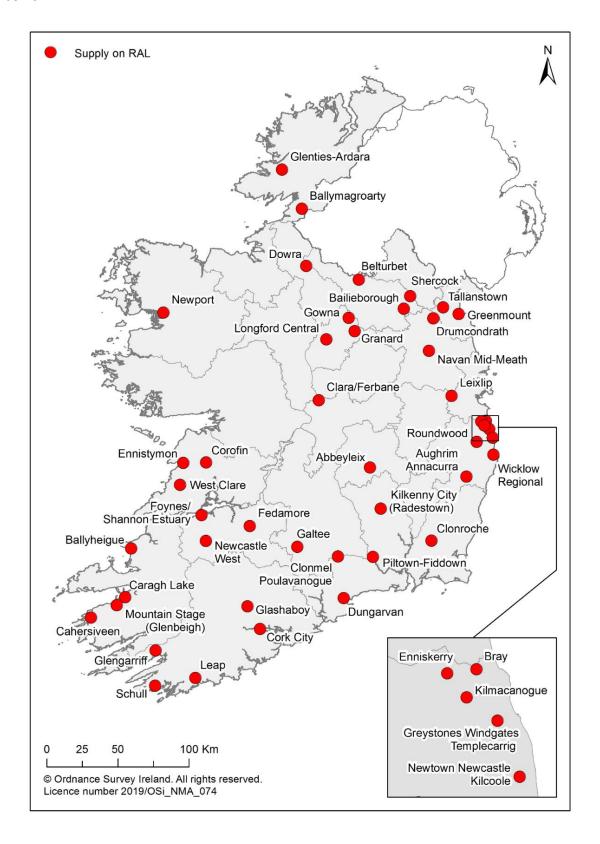

Figure 1: Supplies on RAL at the end of 2020.

While Irish Water continues to make progress with a net reduction in supplies on the RAL, the EPA has serious concerns about the time it takes to implement improvements at supplies. Figure 2 shows the expected completion timeframes for improvement works for the supplies which were on the RAL at the end of 2020.

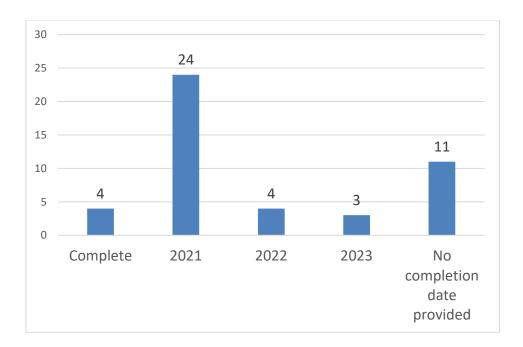

Figure 2: Expected timeframes for completion of works for supplies on the RAL at end of 2020

There continues to be delays in completing action programmes for supplies on the RAL. Of the 46 supplies on the RAL at the end of 2020, almost half will now take longer to complete than was anticipated at the end of 2019, for example, Tallanstown and Pilltown-Fiddown supplies. Other examples include Galtee Regional which has an uncertain completion date, and Clonmel-Poulavanogue, on the RAL since 2008, which will not now be completed until 2026. These delays compound the delays already highlighted in the 2019 report.

Actions required

While Irish Water is making progress on reducing supplies on the RAL at the end of 2020, they must prioritise the remaining supplies for upgrades and take all necessary measures to resolve these issues without any further delays.

Drinking Water Priority 1: Ensure that water is free of bacteria

Disinfection is the most important step of the water treatment process. It keeps our water supplies safe from pathogens such as bacteria, which can cause illness. Disinfection can be carried out using chlorination and ultra-violet light, to kill or deactivate pathogens.

Irish Water are implementing a National Disinfection Programme⁵ to ensure that standard specifications for disinfection systems are met at all 'sites', that is, water treatment plants or other locations such as chlorine booster stations. The Programme is split over two phases:

- Phase 1 Site Assessment: Irish Water assess the condition and performance of the
 existing disinfection systems. This determines the improvements needed to ensure that
 the site disinfection process meets the requirements.
- Phase 2 Site Upgrade Works: Irish Water carries out the works identified in Phase 1.

A supply may be placed on the RAL if critical disinfection infrastructure is absent or if there is persistent presence of *E. coli* or *Enterococci* in the treated water.

Findings for 2020

There are currently no supplies on the RAL under these criteria. This is because all plants have some form of disinfection in place before the water is provided to consumers.

However, in some cases, additional infrastructure is required, or the management and control of existing processes is inadequate. In 2020, the EPA issued four Directions (*Appendix D*) to Irish Water where supplies needed improvements. In addition, the EPA through its audit programme has found issues with inadequate disinfection contact time⁶, which were not properly addressed by Irish Water as part of its disinfection programme. These deficiencies in disinfection processes resulted in the need for boil water notices on over 40 small supplies during 2019 and 2020, to protect the health of around 3,000 people served by those supplies. While the issues were resolved and did not require that the supplies went on the RAL, this did cause inconvenience for members of the public which could have been avoided.

⁵ Available at https://www.water.ie/projects-plans/national-projects/national-disinfection-programme/

⁶ Where chlorine is used in disinfection, it needs time (known as contact time) to fully kill any bacteria or viruses, before it reaches the first consumer on the distribution network.

In 2020, disinfection upgrade works were concentrated in counties Limerick, Tipperary, Meath, Offaly, and Cork. By the end of 2020, Irish Water reported that based on the assessment of the 866 sites on the Programme, half of the sites were deemed satisfactory and required no further work. Disinfection systems had been upgraded at a total of 284 sites with 51⁷ sites delivered in 2020. Irish Water said some delays in commissioning these systems were experienced during 2020 due to Covid-19 restrictions.

Actions required

The National Disinfection Programme is of fundamental importance in identifying and addressing issues with disinfection in water supplies. Irish Water must continue to undertake improvements to disinfection systems across the country to ensure that the quality of drinking water is safeguarded.

- Where significant issues are found, for example, inadequate contact time, these should be resolved immediately, to protect public health, rather than waiting for Phase 2;
- All sites that either did not undergo a Phase 1 site survey (for example, due to planned rationalisation⁸) or did not progress beyond a Phase 1 site survey must meet the minimum disinfection criteria as outlined in EPA Advice Note 3⁹ on *E.coli* in Drinking Water;
- In light of EPA audit findings, Irish Water needs to review all Disinfection Programme assessments to ensure disinfection contact time is adequate to protect public health;
- Where disinfection upgrades are completed, Irish Water should ensure those systems
 are commissioned and handed over to the local authority, with the appropriate training,
 in a timely manner.

⁷ Irish Water reported a further two sites as complete under the Disinfection Programme in 2020, however EPA audits during 2021 found that the process monitoring and controls installed under the Disinfection Programme were not operational.

⁸ Rationalisation refers to when a supply is taken out of service and consumers are connected to another supply.

⁹ Advice & Guidance | Environmental Protection Agency (epa.ie)

Drinking Water Priority 2: Ensure that water is free of protozoan organisms

While the disinfection step deals with many pathogens, chlorination on its own is insufficient to kill or deactivate protozoan organisms such as *Cryptosporidium* and *Giardia* which can cause serious gastro-intestinal illness. The Drinking Water Regulations do not explicitly require monitoring of these organisms however, Irish Water is required to determine if there is a risk that they could be present in raw water sources. If so, then appropriate treatment processes (referred to as a 'barrier') must be put in place. *Cryptosporidium* and *Giardia* may be detected in treated water where:

- there is no treatment barrier in place at the water treatment plant; or
- the treatment barrier is not being properly operated, or maintained, or is inadequate.

A supply may be placed on the RAL if detections are persistent or a barrier is not in place.

Findings for 2020

Irish Water detected *Cryptosporidium* or *Giardia* in 18 supplies during 2020, down from 25 supplies in 2019. *Cryptosporidium* was found in 14 public water supplies. *Giardia* was also detected in four of these 14 supplies, plus four others. Of the 18 supplies, five were placed on a boil notice. Two supplies had no barrier, but UV units have since been installed (Mountain Stage, Kerry and Paulstown, Kilkenny).

At the end of 2020 there were seven supplies on the Remedial Action List for inadequate treatment for *Cryptosporidium*, and one (Leixlip) identified by the HSE as requiring further improvement, due to failures at the treatment plant which compromised the barrier. Leixlip, which supplies over 590,000 people, was removed from the RAL in July 2021 following filter upgrades and the installation of UV disinfection.

Actions required

Whilst the reduction in the number of supplies with protozoa detections in 2020 is welcome, the EPA remains concerned that the failure to properly manage treatment barriers is causing a risk to public health because of possible breakthrough of parasites into treated water. It is critical that Irish Water put the appropriate control measures in place to ensure the correct operation of treatment barriers.

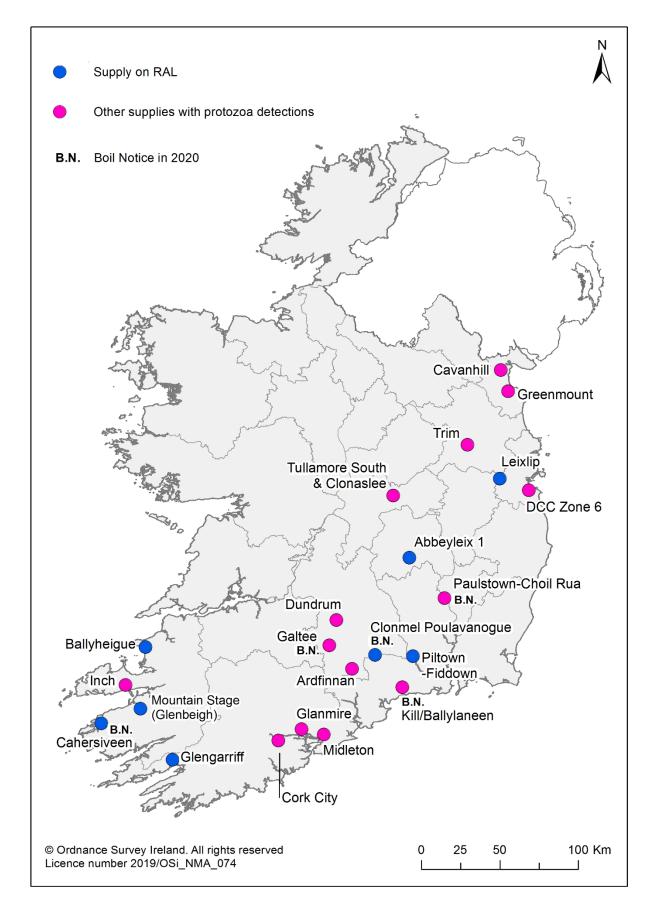

Figure 3: Supplies on RAL for inadequate treatment for protozoa or with protozoa failures during 2020.

Drinking Water Priority 3: Ensure that water is free of chemical substances (trihalomethanes and pesticides)

Trihalomethanes (THMs) form when natural organic matter in the water source, such as rotting vegetation, reacts with chlorine used in the disinfection treatment process. For this reason, it is important to remove as much organic matter as possible from the raw water using processes at the water treatment plant. THMs are a particular concern in Ireland where about 80% of our drinking water is abstracted from rivers and lakes. A supply may be placed on the RAL if there is a persistent failure to meet the $100\mu g/l$ limit and processes are not sufficiently robust to reliably maintain THM levels below that level.

The European Commission started infringement proceedings against Ireland in 2015 for failure to comply with the THM standard in the Drinking Water Directive. In 2018, the European Commission issued a letter of formal notice to Ireland for failing to comply with the THM standard in 73 public water supplies and 24 group water schemes. The Department of Housing, Planning and Local Government responded to the letter advising on Ireland's actions to achieve THM compliance. In May 2020, the Commission issued a Reasoned Opinion that it considered Ireland had failed to take the measures necessary to ensure THM compliance in 31 public water supplies and 13 private group water schemes (listed in the Annex to the Reasoned Opinion). The Department of Housing, Planning and Local Government responded to the Commission in September 2020, advising on Ireland's actions to achieve THM compliance.

Pesticides are found in drinking water due to the incorrect use of such products in the catchment of water bodies used for drinking water abstraction. The term 'Pesticides' includes a wide range of products, but in Ireland, it is herbicides that are most commonly found, in particular, MCPA¹⁰ which is used for rush control in grassland. Where pesticide failures are found, monthly monitoring must be carried out during the spraying season of April to November. A supply is considered to have a persistent pesticide problem if failures are found during four or more of the monthly sampling events. A supply may be placed on the RAL if failures are persistent and initial investigations fail to resolve the issue.

^{10 2-}methyl-4-chlorophenoxyacetic acid

Findings for 2020

Trihalomethanes

35 **public supplies** failed to meet the standard for THMs. This compares to 46 supplies in 2019, with the number of supplies affected steadily decreasing year on year, due to investment by Irish Water in upgrading water treatment plants. Six supplies were removed from the RAL and one was added. At the end of 2020 there were 20 supplies on the RAL for THMs.

The EPA successfully prosecuted Irish Water over the failure to comply with Directions issued on two supplies - Drimoleague and Kealkill Public Water Supplies, Co. Cork. These supplies were removed from the RAL in Quarter 4 2019 and Quarter 2 2020 respectively, following upgrades which resulted in the supplies complying with the THM standard.

Failure to meet the THM standard for a **public group scheme** may be due to the quality of the water supplied by the parent public supply or it may be that the THMs were formed in the public group scheme network.

In 2020, exceedances of the THM standard were found at 20 public group schemes across six counties (see *Appendix E* for the full list). This is an increase from seven schemes in 2019. In Clare, eight schemes with exceedances are fed by West Clare Regional Water Supply. This supply is on the EPA RAL for THMs and continues to fail to meet the THM standard, thus affecting the group schemes which it supplies. In Sligo, the one scheme with an exceedance is fed by Lough Talt which was on the EPA RAL for THMs. Lough Talt was removed from the RAL in 2020 following the completion of works and the group scheme monitoring is now compliant.

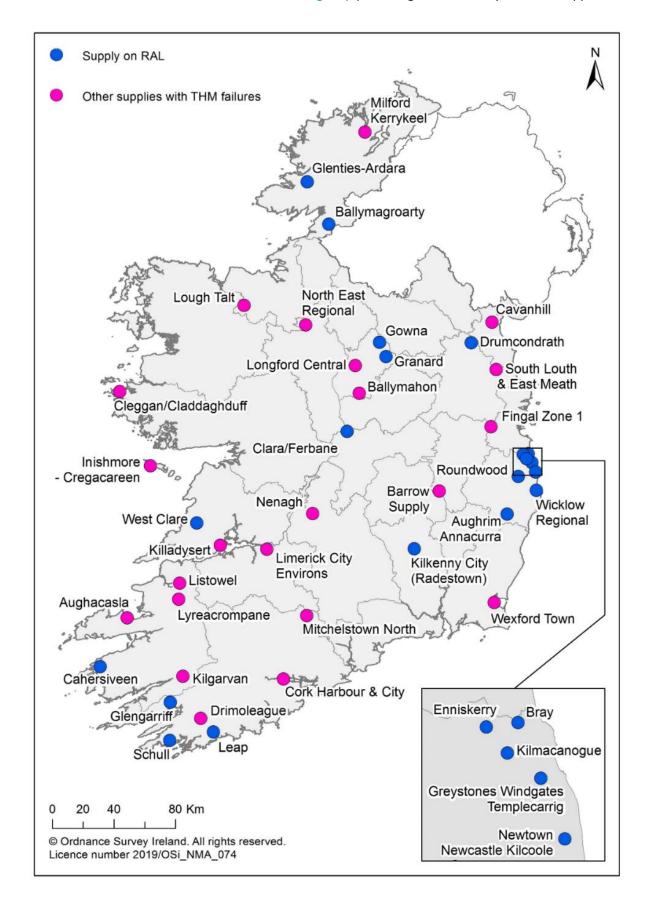

Figure 4: Supplies on RAL for THM or with THM failures during 2020.

Pesticides

33 public supplies failed to meet the pesticides standard, an increase from 27 in 2019, which is indicative of the common usage of pesticides. MCPA was found in two-thirds of these supplies. One supply (Foynes/Shannon Estuary in Limerick) had persistent pesticides failures during 2020 and was added to the RAL. At the end of 2020 there were six supplies on the RAL for pesticides.

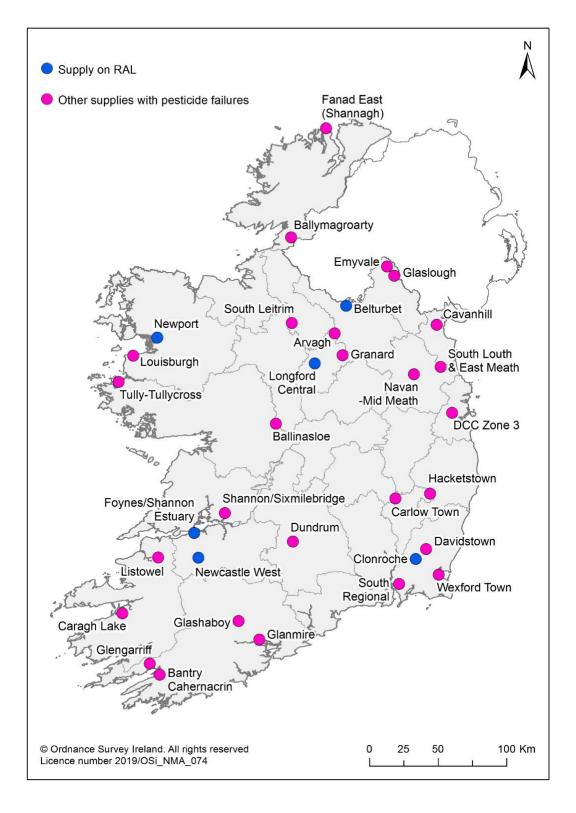

Figure 5: Supplies on RAL for pesticides or with pesticides failures during 2020.

Actions required

It is critical that Irish Water take action to address issues with trihalomethanes at water supplies, to protect public health; to ensure compliance with the THM standard in the Drinking Water Regulations; and to address the concerns of the European Commission.

Local authorities must investigate any THM failures in public group schemes to determine whether the cause is the quality of the water from the parent supply or the conditions in the group scheme network, so that the appropriate corrective action is taken.

In July 2021, Irish Water published an Interim Pesticide Strategy¹¹ for 2021-2024, building on work that has been going on for several years. The Strategy has three pillars: (1) Collaboration with stakeholders; (2) Understanding risk; and (3) Managing risk. It is crucial that Irish Water implement the strategy and consider treatment options where other measures fail to achieve compliance.

¹¹ Interim Pesticide Strategy | Strategic Plans | Irish Water

Drinking Water Priority 4: Ensure that water treatment plants are operated correctly

Persistent aluminium and turbidity failures are indicative of poor control over treatment processes. EPA audits can also identify control and management issues at supplies, such as issues with critical alarms and monitors. These can result in situations where disinfection, protozoal removal/deactivation, or other processes are not optimised.

A supply may be placed on the RAL if aluminium or turbidity failures are persistent or if an EPA audit finds that poor control or management pose a risk to the reliable treatment of the water.

Findings for 2020

During 2020, three supplies were added to the RAL due to turbidity issues or following an audit. These included the Dungarvan supply where treatment plant upgrades are required to manage elevated turbidity levels in the raw water.

At the end of 2020 there were five supplies on the RAL for aluminium, three for turbidity, and 19 for treatment and management failings identified during audits.

Actions required

Irish Water must ensure that consistent and documented operational control and management measures are in place at all supplies, for example;

- Where turbidity in the raw water fluctuates, appropriate monitoring to ensure that treatment is adjusted where necessary;
- Optimisation of aluminium dosing;
- Operational monitoring to assess plant performance on an ongoing basis;
- Monitors and alarms with appropriate set points in place and operational at all times;
- Staff trained and available to respond to alarms and incidents.

4 Protection of human health

Boil water notices and water restrictions

A failure or incident at a supply can put the water quality at risk. The Health Service Executive is responsible for public health and must be consulted by Irish Water where a water quality failure or incident could result in a public health risk. In these events, a boil water notice or water restriction notice may be imposed.

It is critical that such failures or incidents are responded to promptly. Failure to adequately respond and take the appropriate actions up to and including the imposition of a boil water notice or water restriction can have a significant impact on public health. The consequences of consuming inadequately treated water can be very severe, particularly in vulnerable people, such as the young, the elderly, and those with underlying conditions.

While a boil water notice or water restriction causes inconvenience to consumers, they are necessary to ensure that members of the public do not consume water that could be contaminated and make them ill. Irish Water must also take prompt action to ensure that the duration of the notice period is as short as possible.

During 2020, 43 **boil notices** were in place at 37 supplies across 19 counties affecting 74,955 consumers (*Appendix F, Table 1*).

- 27 were in place for more than 30 days, with 18 in place for more than one year;
- Three supplies which had notices in 2019, had notices again in 2020;
- At the end of 2020, 14 boil notices were still in place.

Despite the fact that drinking water quality has remained consistently very good since 2017, Table 2 shows that there has been no overall reduction in boil water notices despite the Irish Water Disinfection Programme having commenced in 2016.

Table 2: Boil Water Notices from 2017 to 2020

Year	Number of notices	In place for > 30 days ¹²	Total population affected during year
2017	42	19	21,657
2018	44	18	97,204
2019	68 ¹³	59	696,864 ¹⁴
2020	43	27	74,955

During 2020, 17 water restrictions were in place on 12 supplies across nine counties, affecting 4,118 people (*Appendix F, Table 2*).

- 10 were in place for more than 30 days, with one in place for more than one year;
- At the end of 2020, four water restrictions notices were still in place.

Of the 17 notices, five were due to cast iron mains giving rise to inadequate chlorine in different parts of the Central Regional Lough Guitane supply. Three of these were still in place at the end of 2020, along with the water restriction in Ballydermody, Co. Waterford which is a disputed supply between Irish Water and the Local Authority.

Table 3: Water Restriction Notices from 2017 to 2020

Year	Number of notices	In place for > 30 days ¹⁵	Total population affected during year
2017	4	3	233
2018	15	7	14,613
2019	8	4	9,186
2020	17	10	4,118

¹² As of end of 2020.

¹³ This figure includes 41 notices issued due to inadequate contact time on parts of supplies; and a notice on Ballany, Westmeath supply, issued on 31/12/2019, not included in 2019 report.

¹⁴ This figure includes the 657,395 people supplied by Leixlip water treatment plant, affected by two notices in 2019.

¹⁵ As of 31/12/2020

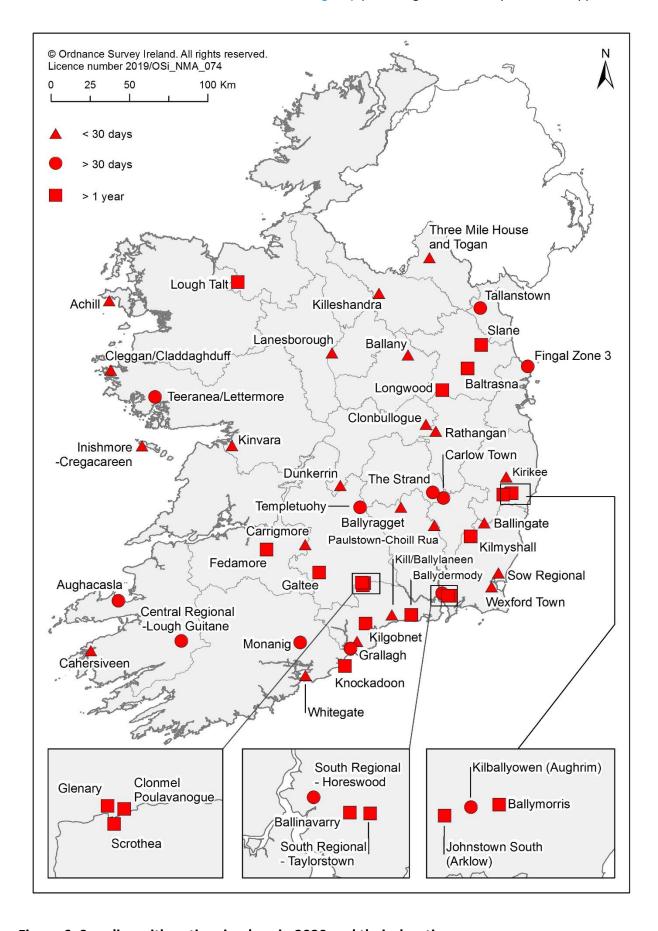

Figure 6: Supplies with notices in place in 2020 and their duration

Topic Box: Boil water notices at Lough Talt supply, Co. Sligo

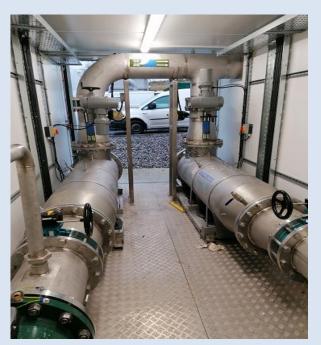

Lough Talt Public Water Supply, Co. Sligo (as seen on the cover of this report), which serves around 12,500 people, was put on the RAL as there was no *Cryptosporidium* barrier in place, and this posed a risk to public health. A series of refusals of planning permission for the site resulted in significant delay in the provision of suitable treatment to address this deficiency.

Over the period of February to October 2018 and again from January 2019 to November 2020, consumers on the supply had to boil their water following detections of *Cryptosporidium* at the water treatment plant.

Planning permission was finally granted in May 2019 under the *Imperative Reasons of Overriding Public Interest (IROPI)* process. The new plant included the installation of a UV system which provides a *Cryptosporidium* barrier. The boil water notice was lifted in November 2020 after an Irish Water / HSE consultation, and the supply was also taken off the RAL.

The new plant comprises coagulation (to be used when water quality triggers are met), rapid gravity filtration, primary disinfection by way of UV and a virus-targeted dose of chlorine, and secondary disinfection for the distribution network using chloramination. Ortho-phosphate is also used, to reduce the risk of dissolving lead and other metals from distribution pipework. These works have improved the safety and security of the supply for the consumers.

Reducing exposure to lead

The Irish Government published a <u>National Lead Strategy</u>¹⁶ in June 2015. The strategy sets out actions to reduce people's exposure to lead from lead piping or connections in buildings and homes, and these actions are reported on by the Department of Housing, Planning and Local Government.

In May 2017 Irish Water published its <u>Lead in Drinking Water Mitigation Plan</u>¹⁷ which sets out Irish Water's plan to achieve the removal of all public side lead pipework by 2026. Irish Water estimated that there were 180,000 lead service connections, i.e. 140,000 connections from water mains and 40,000 backyard service connections.

The new Drinking Water Directive (EU) 2020/2184 18 is to be transposed into Irish law by January 2023 and will include a reduction in the lead limit from 10 μ g/l to 5 μ g/l; to be achieved by January 2036. Compliance with this limit will most likely not be achievable without the replacement of all lead connections.

Findings for 2020

The Department of Housing, Planning and Local Government has not yet published a report on progress with the National Lead Strategy, so the number and location of public buildings affected; the number of people exposed; and plans to remove lead are still not known.

Just over 3,000 individual lead connections were replaced by Irish Water in 2020, compared to 15,000 in 2019. This brings the total number of connections replaced to 34,500, or just under one-fifth of the total to be replaced by Irish Water. Ortho-phosphate dosing¹⁹ commenced at one additional water supply. If Irish Water continue to replace lead connections at the 2020 rate, it will take half a century to address the risks posed to public health from lead in drinking water.

¹⁶Available at https://www.gov.ie/en/publication/f76ee-national-lead-strategy-june-2015/

¹⁷ Available at https://www.water.ie/projects-plans/our-plans/lead-mitigation-plan/

¹⁸ https://eur-lex.europa.eu/eli/dir/2020/2184/oj

¹⁹ Ortho-phosphate dosing can create a lining that limits the amount of lead solubilising off the pipe surface.

Actions required

The EPA is very concerned at the lack of urgency on this issue, both by Irish Water under their Mitigation Plan and the Department of Housing, Planning and Local Government under the National Lead Strategy. It is not acceptable that these works, which would reduce people's exposure to lead in drinking water and deliver such an important public health outcome, are being delayed.

Homeowners can also take action when they are informed by Irish Water that they have lead in their water. They can make use of the <u>Lead Remediation Grant Scheme</u> which is available through local authorities to assist with the costs of replacing lead plumbing. The grant is currently means tested but a review of the eligibility criteria is underway to allow more people to avail of it to replace their lead pipework. The EPA also encourages homeowners who share a backyard connection that contains lead to allow such works to take place, as removing lead pipework is the best way to protect consumers from the health risks associated with lead.

Drinking Water Safety Plans

Irish Water are undertaking a comprehensive review, known as a Drinking Water Safety Plan, of all public supplies. Drinking Water Safety Plans are a proactive approach to ensuring that a water supply is not only **safe**, but also **secure**, thus providing greater certainty for the consumer that their drinking water supply will remain safe to drink. A Drinking Water Safety Plan identifies:

- all the things that could go wrong (hazards);
- how serious it would be if it did go wrong (severity); and
- how likely it is that it could go wrong (likelihood);

at each step in the water supply process, from the water source to the consumer's tap. The aim is to identify, manage and mitigate risk. Irish Water is carrying out assessments of all public water supplies, by assessing and calculating the risk of any hazards occurring, using the severity and likelihood information. Once risks are identified, actions must be taken to mitigate those risks. A national overview can be taken to ensure that the highest risks are dealt with first, under the relevant Irish Water programmes.

The new Drinking Water Directive (EU) 2020/2184 is to be transposed into Irish law by January 2023 and it is anticipated that this will put the requirement for Drinking Water Safety Plans on a statutory footing.

Findings for 2020

Irish Water is committed to the Drinking Water Safety Plan approach and have taken action during 2020 to improve the assessment methodology. At the end of 2020, Irish Water report that they have substantially completed a treatment/distribution risk assessment of 72 water supply zones which supply 44% of consumers.

Actions required

Irish Water needs to substantially progress drinking water safety plan assessments to identify risks at drinking water supplies and to safeguard the long-term security of water supplies.

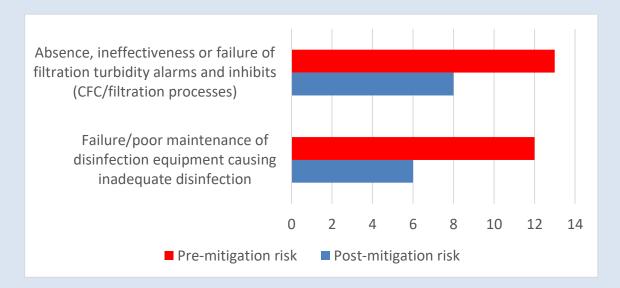

Where assessments have been completed, Irish Water must ensure the highest risks identified are prioritised for action so that they can be addressed in a timely manner.

Topic Box: Application of Drinking Water Safety Plan at Swanlinbar public water supply

Swanlinbar supply was placed on the EPA RAL in July 2019 following an audit which identified issues around the management and control of the treatment processes at the supply.

Irish Water carried out a DWSP assessment to systematically identify the risks at the supply. The DWSP identified aspects of primary disinfection and protozoan removal as high risks. The disinfection system was upgraded to an automated process with full controls; and the control of the coagulation/flocculation/clarification (CFC) process and the rapid gravity filtration (RGF) process was improved in accordance with the requirements of the EPA filtration manual.

These works resulted in a reduction in the risk associated with the two barriers. For example:

The supply was removed from the EPA in July 2020.

5 Concluding Remarks

The quality of drinking water in public supplies and public group water schemes remained very high in 2020. Progress was made on the removal of supplies from the Remedial Action List (RAL) and the number of supplies with protozoa detections and trihalomethane issues also decreased.

However, the EPA has serious concerns about the time it takes to implement improvements at supplies on the RAL. Of the 46 supplies on the RAL at the end of 2020, almost half will now take longer to complete than was anticipated at the end of 2019.

Boil notices and water restrictions continued to impact consumers during 2020, with nearly two-thirds of the notices in place for more than 30 days. Assessments and improvements under the disinfection programme have not proved sufficiently robust to mitigate the need for boil notices.

Thousands of consumers continue to be exposed to lead in their drinking water also, with Irish Water's replacement rates indicating that it will be decades before this issue is resolved. A lack of progress by the government on the National Lead Strategy and the forthcoming reduced limit for lead are of serious concern.

The EPA welcomes the progress made on the identification of key risks at supplies using the Drinking Water Safety Plan approach. Irish Water must also substantially progress the use of drinking water safety plans across their entire portfolio of water treatment infrastructure so as to determine the highest risks. This is essential in targeting actions to address those risks and to ensure a resilient public water supply.

Although the quality of our water is safe to drink today, the EPA currently cannot say that it is secure into the future. Irish Water must resolve the priority supplies on the RAL and ensure future actions are targeted where they are most needed to protect public health.

Appendix A: Remedial Action List at end of 2020

County	Supply	Population	Date supply put on the RAL	Completion date for action plan	Reason
Cavan	Bailieborough	7785	Q4 2019	December 2021	EPA Audit Observation - Treatment and Management Issues
Cavan	Belturbet	1926	Q4 2018	EPA Direction required compliance by December 2020. Monitoring underway to verify effectiveness of the action programme.	Elevated Levels of Pesticides above the standard in the Drinking Water Regulations

Environmental Protection Agency | Drinking Water Quality in Public Supplies 2020

AN GHNÍOMHAIREACHT UM CHAOMHNÚ COMHSHAOIL

Tá an Ghníomhaireacht um Chaomhnú Comhshaoil (GCC) freagrach as an gcomhshaol a chaomhnú agus a fheabhsú mar shócmhainn luachmhar do mhuintir na hÉireann. Táimid tiomanta do dhaoine agus don chomhshaol a chosaint ó éifeachtaí díobhálacha na radaíochta agus an truaillithe.

Is féidir obair na Gníomhaireachta a roinnt ina trí phríomhréimse:

Rialú: Déanaimid córais éifeachtacha rialaithe agus comhlíonta comhshaoil a chur i bhfeidhm chun torthaí maithe comhshaoil a sholáthar agus chun díriú orthu siúd nach gcloíonn leis na córais sin.

Eolas: Soláthraímid sonraí, faisnéis agus measúnú comhshaoil atá ar ardchaighdeán, spriocdhírithe agus tráthúil chun bonn eolais a chur faoin gcinnteoireacht ar gach leibhéal.

Tacaíocht: Bímid ag saothrú i gcomhar le grúpaí eile chun tacú le comhshaol atá glan, táirgiúil agus cosanta go maith, agus le hiompar a chuirfidh le comhshaol inbhuanaithe.

Ár bhFreagrachtaí

Ceadúnú

Déanaimid na gníomhaíochtaí seo a leanas a rialú ionas nach ndéanann siad dochar do shláinte an phobail ná don chomhshaol:

- saoráidí dramhaíola (m.sh. láithreáin líonta talún, loisceoirí, stáisiúin aistrithe dramhaíola);
- gníomhaíochtaí tionsclaíocha ar scála mór (m.sh. déantúsaíocht cógaisíochta, déantúsaíocht stroighne, stáisiúin chumhachta);
- an diantalmhaíocht (m.sh. muca, éanlaith);
- úsáid shrianta agus scaoileadh rialaithe Orgánach Géinmhodhnaithe (OGM);
- foinsí radaíochta ianúcháin (m.sh. trealamh x-gha agus radaiteiripe, foinsí tionsclaíocha);
- áiseanna móra stórála peitril;
- · scardadh dramhuisce;
- gníomhaíochtaí dumpála ar farraige.

Forfheidhmiú Náisiúnta i leith Cúrsaí Comhshaoil

- Clár náisiúnta iniúchtaí agus cigireachtaí a dhéanamh gach bliain ar shaoráidí a bhfuil ceadúnas ón nGníomhaireacht acu.
- Maoirseacht a dhéanamh ar fhreagrachtaí cosanta comhshaoil na n-údarás áitiúil.
- Caighdeán an uisce óil, arna sholáthar ag soláthraithe uisce phoiblí, a mhaoirsiú.
- Obair le húdaráis áitiúla agus le gníomhaireachtaí eile chun dul i ngleic le coireanna comhshaoil trí chomhordú a dhéanamh ar líonra forfheidhmiúcháin náisiúnta, trí dhíriú ar chiontóirí, agus trí mhaoirsiú a dhéanamh ar leasúchán.
- Cur i bhfeidhm rialachán ar nós na Rialachán um Dhramhthrealamh Leictreach agus Leictreonach (DTLL), um Shrian ar Shubstaintí Guaiseacha agus na Rialachán um rialú ar shubstaintí a ídíonn an ciseal ózóin.
- An dlí a chur orthu siúd a bhriseann dlí an chomhshaoil agus a dhéanann dochar don chomhshaol.

Bainistíocht Uisce

- Monatóireacht agus tuairisciú a dhéanamh ar cháilíocht aibhneacha, lochanna, uiscí idirchriosacha agus cósta na hÉireann, agus screamhuiscí; leibhéil uisce agus sruthanna aibhneacha a thomhas.
- Comhordú náisiúnta agus maoirsiú a dhéanamh ar an gCreat-Traoir Llisca
- Monatóireacht agus tuairisciú a dhéanamh ar Cháilíocht an Uisce Snámha.

Monatóireacht, Anailís agus Tuairisciú ar an gComhshaol

- Monatóireacht a dhéanamh ar cháilíocht an aeir agus Treoir an AE maidir le hAer Glan don Eoraip (CAFÉ) a chur chun feidhme.
- Tuairisciú neamhspleách le cabhrú le cinnteoireacht an rialtais náisiúnta agus na n-údarás áitiúil (m.sh. tuairisciú tréimhsiúil ar staid Chomhshaol na hÉireann agus Tuarascálacha ar Tháscairí).

Rialú Astaíochtaí na nGás Ceaptha Teasa in Éirinn

- Fardail agus réamh-mheastacháin na hÉireann maidir le gáis cheaptha teasa a ullmhú.
- An Treoir maidir le Trádáil Astaíochtaí a chur chun feidhme i gcomhair breis agus 100 de na táirgeoirí dé-ocsaíde carbóin is mó in Éirinn.

Taighde agus Forbairt Comhshaoil

• Taighde comhshaoil a chistiú chun brúnna a shainaithint, bonn eolais a chur faoi bheartais, agus réitigh a sholáthar i réimsí na haeráide, an uisce agus na hinbhuanaitheachta.

Measúnacht Straitéiseach Timpeallachta

 Measúnacht a dhéanamh ar thionchar pleananna agus clár beartaithe ar an gcomhshaol in Éirinn (m.sh. mórphleananna forbartha).

Cosaint Raideolaíoch

- Monatóireacht a dhéanamh ar leibhéil radaíochta, measúnacht a dhéanamh ar nochtadh mhuintir na hÉireann don radaíocht ianúcháin.
- Cabhrú le pleananna náisiúnta a fhorbairt le haghaidh éigeandálaí ag eascairt as taismí núicléacha.
- Monatóireacht a dhéanamh ar fhorbairtí thar lear a bhaineann le saoráidí núicléacha agus leis an tsábháilteacht raideolaíochta.
- Sainseirbhísí cosanta ar an radaíocht a sholáthar, nó maoirsiú a dhéanamh ar sholáthar na seirbhísí sin.

Treoir, Faisnéis Inrochtana agus Oideachas

- Comhairle agus treoir a chur ar fáil d'earnáil na tionsclaíochta agus don phobal maidir le hábhair a bhaineann le caomhnú an chomhshaoil agus leis an gcosaint raideolaíoch.
- Faisnéis thráthúil ar an gcomhshaol ar a bhfuil fáil éasca a chur ar fáil chun rannpháirtíocht an phobail a spreagadh sa chinnteoireacht i ndáil leis an gcomhshaol (m.sh. Timpeall an Tí, léarscáileanna radóin).
- Comhairle a chur ar fáil don Rialtas maidir le hábhair a bhaineann leis an tsábháilteacht raideolaíoch agus le cúrsaí práinnfhreagartha.
- Plean Náisiúnta Bainistíochta Dramhaíola Guaisí a fhorbairt chun dramhaíl ghuaiseach a chosc agus a bhainistiú.

Múscailt Feasachta agus Athrú Iompraíochta

- Feasacht chomhshaoil níos fearr a ghiniúint agus dul i bhfeidhm ar athrú iompraíochta dearfach trí thacú le gnóthais, le pobail agus le teaghlaigh a bheith níos éifeachtúla ar acmhainní.
- Tástáil le haghaidh radóin a chur chun cinn i dtithe agus in ionaid oibre, agus gníomhartha leasúcháin a spreagadh nuair is gá.

Bainistíocht agus struchtúr na Gníomhaireachta um Chaomhnú Comhshaoil

Tá an ghníomhaíocht á bainistiú ag Bord lánaimseartha, ar a bhfuil Ard-Stiúrthóir agus cúigear Stiúrthóirí. Déantar an obair ar fud cúig cinn d'Oifigí:

- An Oifig um Inmharthanacht Comhshaoil
- An Oifig Forfheidhmithe i leith cúrsaí Comhshaoil
- An Oifig um Fianaise is Measúnú
- Oifig um Chosaint Radaíochta agus Monatóireachta Comhshaoil
- An Oifig Cumarsáide agus Seirbhísí Corparáideacha

Tá Coiste Comhairleach ag an nGníomhaireacht le cabhrú léi. Tá dáréag comhaltaí air agus tagann siad le chéile go rialta le plé a dhéanamh ar ábhair imní agus le comhairle a chur ar an mBord.
